

TAKE THE BITE OUT OF HEARTWORM DISEASE!

Mosquitoes remain the only known source
of heartworm infection transmission.

Ask us about protecting your dog from
mosquito bites as part of a comprehensive
heartworm prevention plan.

TAKE THE BITE OUT OF HEARTWORM DISEASE!

Mosquitoes remain the only known source of heartworm infection transmission.

Backyard Mosquito Mitigation

You want to be outside with your dog enjoying nice weather. Preventing mosquito bites makes everyone happier, more comfortable, and in the case of heartworm prevention in dogs, healthier too.

You can help eliminate mosquito breeding grounds in your backyard with these strategies:

- Empty, wash, and refill outdoor water bowls daily to remove any mosquito eggs before they hatch (typically in 24–48 hours after being laid).
- Empty and turn over baby pools, bird baths, and yard items, such as buckets, when not in use.
- Resolve any landscaping areas where water from sprinklers or rain can pool.
- Keep screens on any open windows and doors.

Talk to your veterinarian about appropriate heartworm prevention for your dog.
